## Summary

### Programme background 2012-13

This year has witnessed another period of disruption for breast screening services in Wales. The suspension of screening and new ways of working following the introduction of digital mammography has negatively impacted upon waiting times for results and assessments and resulted in an increasing round length. However, overall programme performance against the core NHSBSP standards remains excellent (see Appendix A). The positive impact of current interventions to address the issue of round length and shorter waits for results and assessment should be reflected in next year's programme performance report.

### Coverage

Coverage is defined as the percentage of women resident and eligible for breast screening at a particular point in time who have been screened within the previous 3 years. As at 31<sup>st</sup> March 2013 coverage of women aged 53-70 was 66.1%, compared with 70.5% at the same point in 2012 and 74.6% in 2011.

### Screening activity

Just over 93,000 women aged 49 and over were screened in 2012-13. Due to the disruption associated with digital implementation this is a sizeable drop compared to the 109,000 screened in 2010 but is 10,000 more than last year and should be the start of a recovery in terms of screening activity.

### Invitation and uptake

In 2012-13 just over 118,000 women aged 50-70 were invited for screening, compared to 102,000 last year. Uptake of those routinely invited and aged 50-70 was 71.2%, compared to 73.2% in 2011-12 and 74.3% in 2010. Uptake is one of several indicators of programme performance monitored on a monthly basis at unit level.

### Assessment

Referrals for assessment stood at 5.5% of those screened in 2012-13. This compares to 5.3% last year and 5.1% in 2010.

### Cancer detection

A total of 956 cancers were detected in women screened aged 49 and over. This represents 10.2 cases per 1000 women screened. In comparison, there were 816 cancers detected in 2011 (9.8 per 1000 screened) and 1050 detected in 2010 (9.6 per 1000 screened). Of the 956 cancers detected this year, 79% (755) were invasive lesions. In 2011 78.1% (637) were invasive and in 2010 79.9% (839). In 2012-13 51.7% (390) of the invasive cancers detected were classified as small (less than 15mm in size). This compares to 54.2% (345) in 2011 and 51.6% (433) in 2010.

## Coverage

Coverage is defined as the percentage of women resident and eligible for breast screening at a particular point in time who have been screened within the previous 3 years. Ineligible women includes those who have undergone bilateral mastectomy.

Both uptake and round length can affect coverage. Because women are not necessarily screened when they turn 50 coverage is presented for the 53-70 age range.

As at 31<sup>st</sup> March 2013 coverage of women aged 53-70 was 66.1%, compared with 70.5% at the same point in 2012 and 74.6% in 2011.

The effect of the increasing round length resulting from digital implementation is illustrated in Figure 1. The only Health Board not to experience a drop in coverage compared to the previous year is Cwm Taf University and for the first time the minimum standard of 70% has not been achieved at the all Wales level.

*Figure 1: Breast screening coverage among women aged 53-70, by Health Board, 2011-2013*

## Screening Activity

Women may be routinely invited to attend breast screening if they are aged between 50 and 70 (or aged 49 if they are 50 in the year their practice is screened) or may self refer once older than 70. England has taken the decision to extend the invited age range to 47-73 but there are no current plans to replicate this elsewhere in the UK.

In total, just over 93,000 women aged 49 and over were screened in 2012-13. Due to the disruption to screening associated with digital implementation this represents a sizeable drop compared to the 109,000 screened in 2010 but 10,000 more than last year. Figure 2 illustrates the general trend of increasing screening numbers over the years.

*Figure 2: 10-year total screening activity, 2003-04 to 2012-13*

## Invitation and Uptake

A stated aim of the NHS breast screening programme is to maximise the number of eligible women who attend for screening. To facilitate this, a national minimum standard for uptake of a routine invitation in those aged 50-70 has been set at 70%. Unfortunately, Breast Test Wales has witnessed a steady decline in uptake in recent years.

In 2012-13 uptake stood at 71.2%, compared to 73.2% in 2011 and 74.3% in 2010. Figure 3 shows uptake of screening amongst the routinely invited population (aged 50-70 from 2007, aged 50-64 prior to this).

Figure 3: 10-year uptake of routine breast screening invitations, 2003-04 to 2012-13

Uptake can vary according to the type of invitation. Routine invitations can be sub-divided into the following groups:

- First invitation (KC table A)
- Invitation to a previous non-attender (KC table B)
- Invitation to a previous attender who has been screened within the last 5 years (KC table C1)
- Invitation to a previous attender but screened more than 5 years ago (KC table C2)

As Figure 4 demonstrates, uptake is highest among the regular attendees (Table C1 – 87.0%) and lowest among persistent non-attenders (Table B – 13.2%).

Figure 4: Uptake by invite type, 2010-11 to 2012-13

In terms of regional breakdown uptake is slightly higher in the South West compared to the other 2 screening units (Figure 5). All 3 regions have witnessed a decline in uptake in 2012/13, with the South East dropping close to the minimum standard. Uptake for all screening units is continually monitored on a monthly basis.

Figure 5: Uptake by screening unit, 2010-11 to 2012-13

## Assessment

### Referral for assessment

Should abnormalities be detected following screening, a woman will be recalled to undergo further assessment tests. An important aim of the programme is to minimise subjecting women to unnecessary anxiety and investigative procedures.

More women are expected to be recalled following the first screen (the prevalent screen) because any disease has had a longer time to develop and there are no prior images to inform the recall decision. Referral rates for women who have been screened previously (the incident screen) are likely to be lower because they will present with more recent disease and the screening history can assist the image reader.

Table 1 shows the gradual rise in referral rates for most invitation/referral types but there is local variation. In contrast to last year, both South East and South West units have seen a small drop in referrals compared to a rise in North Wales (Figure 6). These two units installed digital mammography equipment in the previous 2011-12 period while the North converted during the latter part of 2012-13. Referral rate is another measure that is closely monitored on a monthly basis.

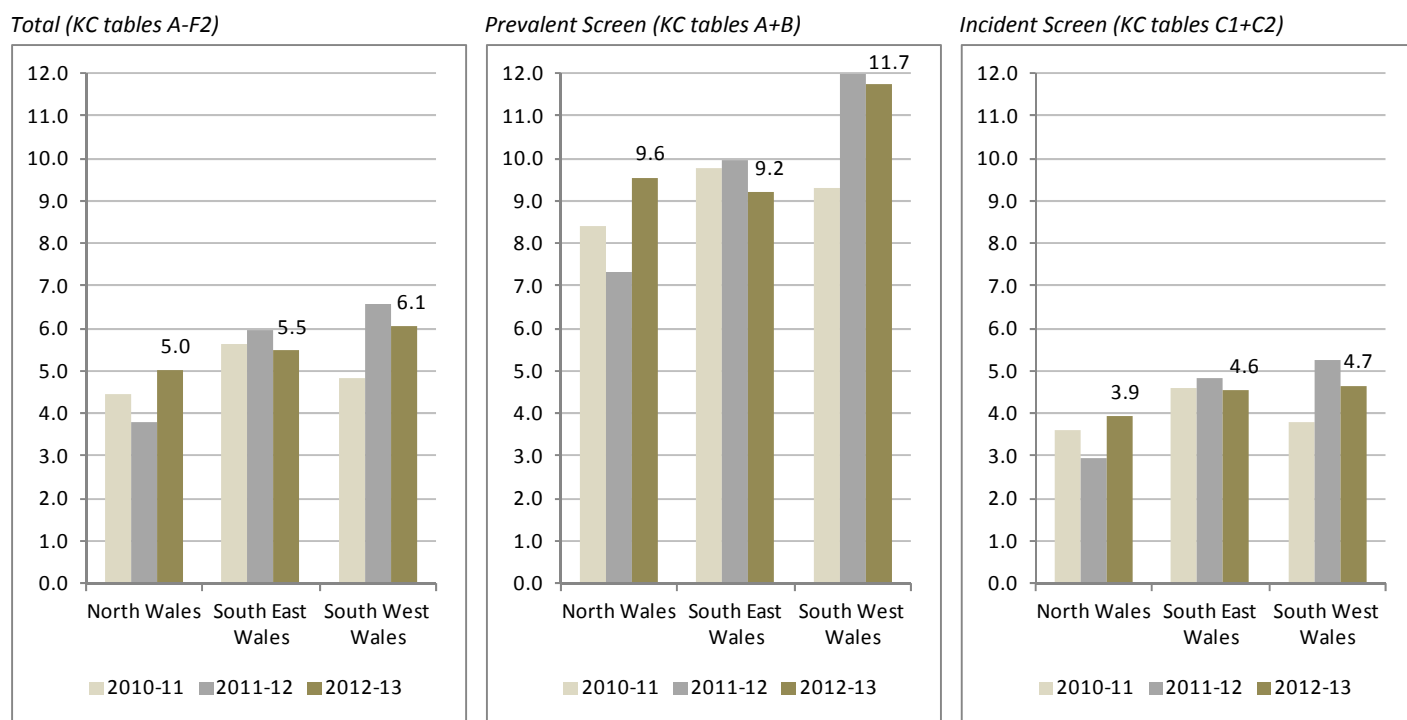

*Table 1: Referral for assessment, all ages, by invite/referral type, 2010-11 to 2012-13*

Figure 6: Referral for assessment, by screening unit, 2010-11 to 2012-13

## Assessment procedures

The assessment procedures that assist diagnosis are fine needle aspiration, wide bore needle and diagnostic open biopsy. The needle procedures are (generally) conducted at a Breast Test Wales unit while an open biopsy is a surgical operation requiring a hospital visit. To minimise anxiety it is desirable to obtain a definitive diagnosis (whether cancer or not) without the need for a hospital admission.

Of the 5170 women referred for assessment in 2012-13, 39% underwent fine needle aspiration and/or wide bore needle, while 3.1% required an open biopsy (Table 2).

Table 2: Referral for assessment procedures, all ages, by invite/referral type, 2010-11 to 2012-13

[See Appendix B, columns 14 & 20 for further breakdown]

## Cancer Detection

### Cancer detection rate

A total of 956 cancers were detected in women screened aged 49 and over. This represents 10.2 cases per 1000 women screened. In comparison, there were 816 cancers detected in 2011 (9.8 per 1000 screened) and 1050 detected in 2010 (9.6 per 1000 screened). The disruption to screening due to digital equipment implementation explains the lower number of women with cancer detected in 2011 and the subsequent increase this year associated with a more settled screening plan.

Cancer detection amongst prevalent screen women was 8.3 per 1000 screened, compared to 10 per 1000 in 2011 and 8.9 per 1000 in 2010. For incident screen women the rate was 10.3 per 1000 screened in 2012-13, 9.1 in 2011 and 9.5 in 2010 (Table 3).

*Table 3: Cancer detection rate (per 1000 women screened), all ages, by invite/referral type, 2010-11 to 2012-13*

	2010-11			2011-12			2012-13

Self/GP referrals (KC tables E+F1+F2)	6886	89	12.9	6039	103	17.1	6924	96	13.9

[See Appendix B, column 12 for further breakdown]

Examination of cancer detection rates at screening unit level (Figure 7) shows similar performance for the total screening population. South West Wales had shown a significant increase in detection last year but this has become more aligned with the other regions in 2012-13.

Figure 7: Cancer detection rate per 1000 women screened, by screening unit, 2010-11 to 2012-13

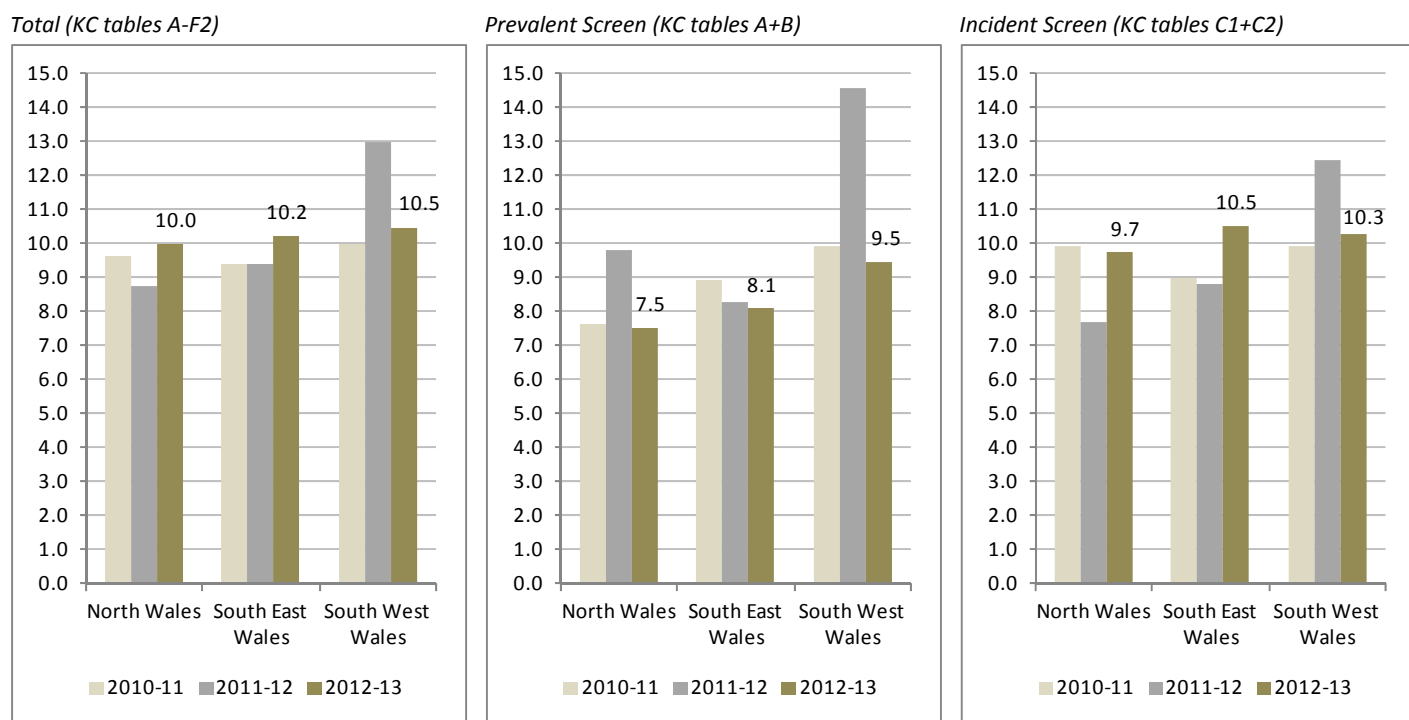

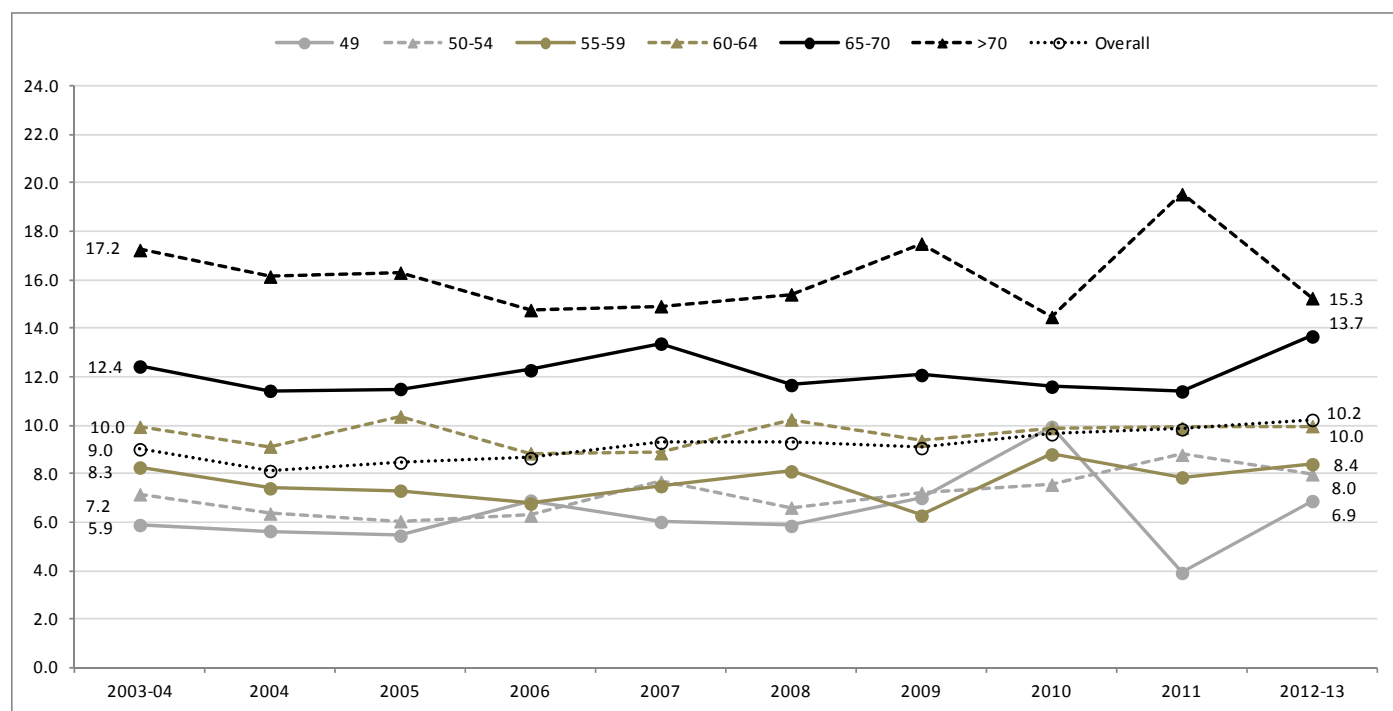

Figure 8 plots cancer detection rates over a 10 year period and shows how breast cancer incidence increases with age. In 2012-13 the cancer detection rate for women aged 50-54 was 8.0 per 1000 screened, rising to 10.0 per 1000 for those aged 60-64 and 13.7 per 1000 in the 65-70 age group.

Figure 8: Cancer detection rate (per 1000 women screened), 2003-04 to 2012-13, by age group

## Cancer type and size

In terms of programme performance and analysis breast cancers are normally split into two groups. An invasive cancer is one which has spread into surrounding, healthy breast tissue. A non-invasive or micro-invasive cancer is contained within the ducts and lobules of the breast or has started to spread but only by a very small amount (less than 1mm).

In 2012-13 79% of the cancers detected in women screened were invasive, compared to 78.1% in 2011 and 79.9% in 2010 (Table 4). The invasive cancers that are generally too small to feel (less than 15mm) accounted for 51.7% of all the invasives detected in 2012-13 (Table 5). This compares to 54.2% last year and 51.6% in 2010.

Non-invasive or micro-invasive disease made up 21% of all cancers detected in 2012-13, while in 2011 they accounted for 21.9% and in 2010 20.1% (Table 6).

Table 4: Invasive cancers detected, all ages, by invite/referral type, 2010-11 to 2012-13
